

ECU Fault Code Check DIAG 01 £14.00

This fault code check is system specific to identify the cause of a warning light illumination. It includes a 'clear-down' and re-set if required. *No diagnostic work is carried out at this stage*

ECU Fault Code Check DIAG 02 £40.00

This is a full serial port interrogation of the **whole vehicle** and includes a full clear-down and service reset if required. *No diagnostic work is carried out at this stage.* You will receive a multi page printed report of the full interrogation including Air Bags; Climate Control; Central Locking; Transmission; Engine; Comfort System &c.,

ECU Interrogation & Engine Diagnosis DIAG 03 £85.00

This includes a full serial port interrogation of the whole vehicle and a full road test to enable an ECU serial port 'real time' analysis and diagnosis to be carried out under driving conditions. The results are compared to the model specific 'flight manual' details to check for inconsistencies and failures. This will usually pinpoint electronic systems component faults and operational failures that have not produced fault codes. This is an intensive and thorough examination and is designed to seek out the most obscure of problems.

Computerised engine diagnosis DIAG 04 £85.00 This is more suitable for older cars (pre 95) that have limited ECU control

A forty point diagnostic check is carried out using a computerised engine analyser. This involves the electrical measurement and interrogation of the vehicle's battery, starting and charging systems; the ignition system, both primary and secondary; and the fuel delivery system. All are checked and measured against manufacturer's specifications. Engine manifold vacuum, engine oil and cooling system running temperatures and exhaust emissions are tested at this stage. Service adjustments and engine tuning is carried out where applicable. ***For vehicles with a computer serial-port fitted as standard, an ECU interrogation is carried out, both for memorised fault-codes and for real-time component monitoring.***

Auto electrical / Electronic fault tracing ECU/component circuit tracing DIAG 05 £65.00 per hour

January 2008

This stage is not exhaustive but is guaranteed to locate and rectify the most obscure of problems. At this level, a search is undertaken for faults or faulty components that have not been clearly identified by standard diagnostic procedures (see above), or where those procedures are not relevant. Suspected components are checked for internal and/or connection faults. This stage often involves the use of a parallel port adapter between the vehicle's ECU and its wiring harness (or further serial port tests); the use of an ECU break-out box, an electronic multi-meter and/or an oscilloscope and dedicated system-specific computer cartridges for your vehicle. ***N.B. Intermittent auto electrical & electronic systems faults can sometimes be very time consuming to locate and rectify. It is important to note that in the event of an intermittent fault failing to present itself during diagnostic fault finding, or a decision 'not to continue' being made, our charges, up to and including that point, will become payable.***
